MS Response

From our investigation it appears that to locate any of the authentication information administrator level privileges are required. This tends to fall under Rule 6 of the 10 Immutable Laws of Security (http://www.microsoft.com/technet/archive/community/columns/security/essays/10imlaws.mspx) where basically you have to trust your administrators.

Microsoft disputes password-stealing SQL Server bug

Angela Moscaritolo September 02, 2009

PRINT | EMAIL | REPRINT | PERMISSIONS | FONT SIZE: A | A | A

For more than a year, Microsoft has been sitting on a purported SQL Server vulnerability that could enable a malicious insider to obtain users' passwords, claims database security vendor Sentrigo.

The software giant, however, said that the issue is not a security flaw.

The potential bug, which Sentrigo notified Microsoft about last September, involves SQL Server keeping passwords unencrypted in its database memory, Slavik Markovich, CTO at Sentrigo, told SCMagazineUS.com on Tuesday. The issue affects SQL Server 2000, 2005 and 2008, running on Windows operating systems.

Definition of Memory Software Analysis

Recovering internal implementation by reading the memory of a running process.

Without disassembling machine code.

The Hedgehog connection

Database activity monitoring

More reasons to read memory

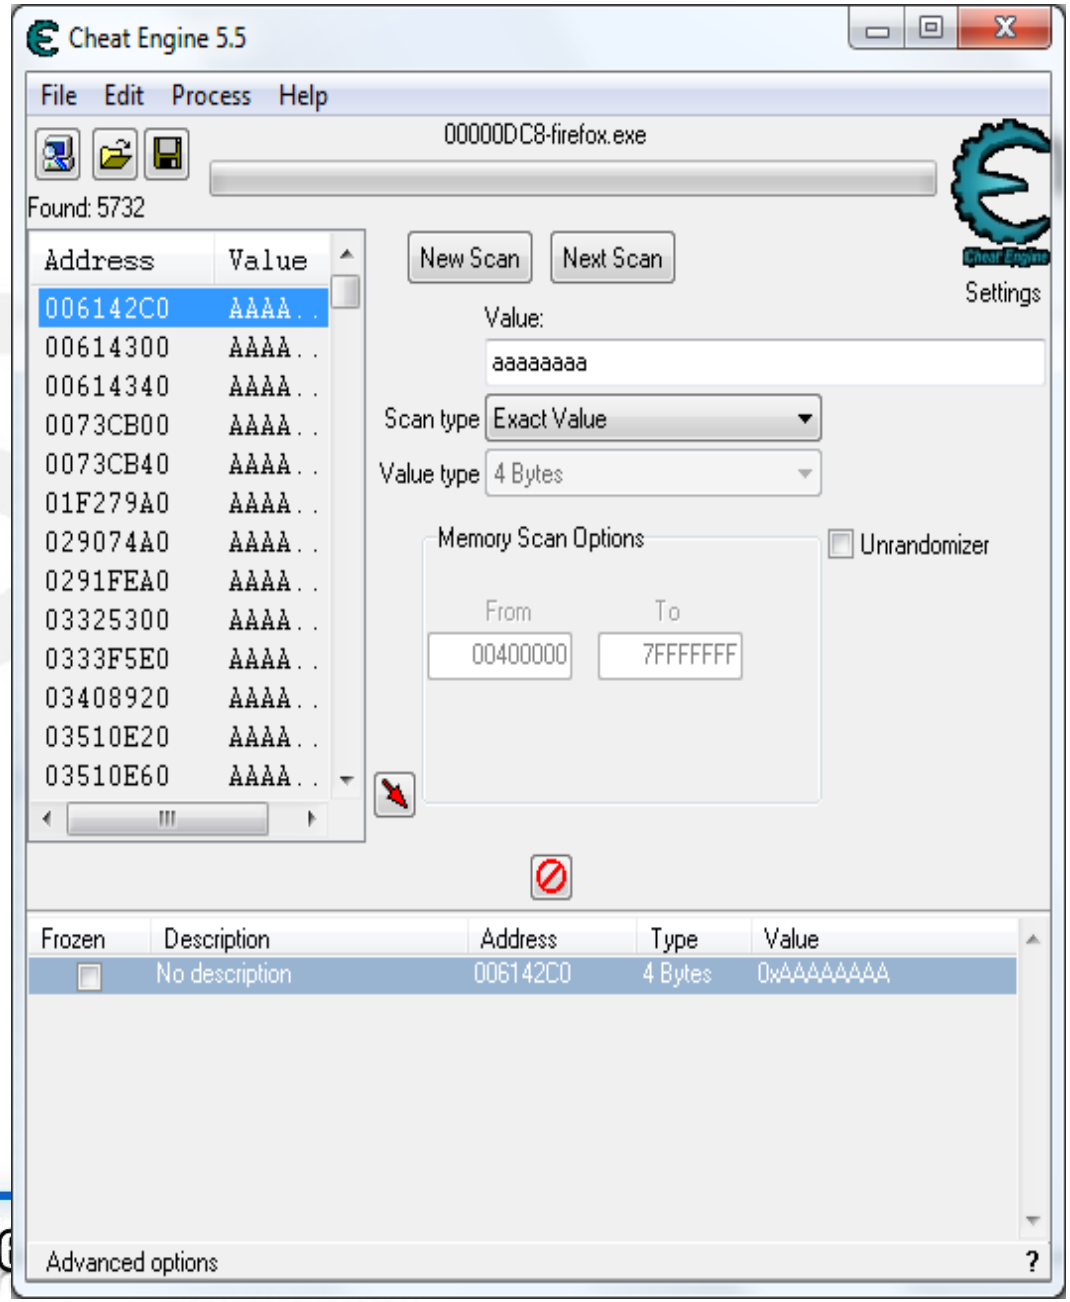
- Not everyone can do SRE, while everyone knows C++
- It's a great new useful method
- Avoiding conflicts with the law

Can be used for

- Security / Monitoring
- Debugging
- Cheating in games

Wait a minute, this ain't new.

- Game cheating engines
- Analysis of crash dumps



The Environment

Tools for the task

- Remote process memory reader
  - Python is just the best
    - PyDbg
    - Mint
  - Any other debugger

API needed

- Read memory
- Search
  - Differential search
- Recursive search
- Wandering around

Reading memory

```

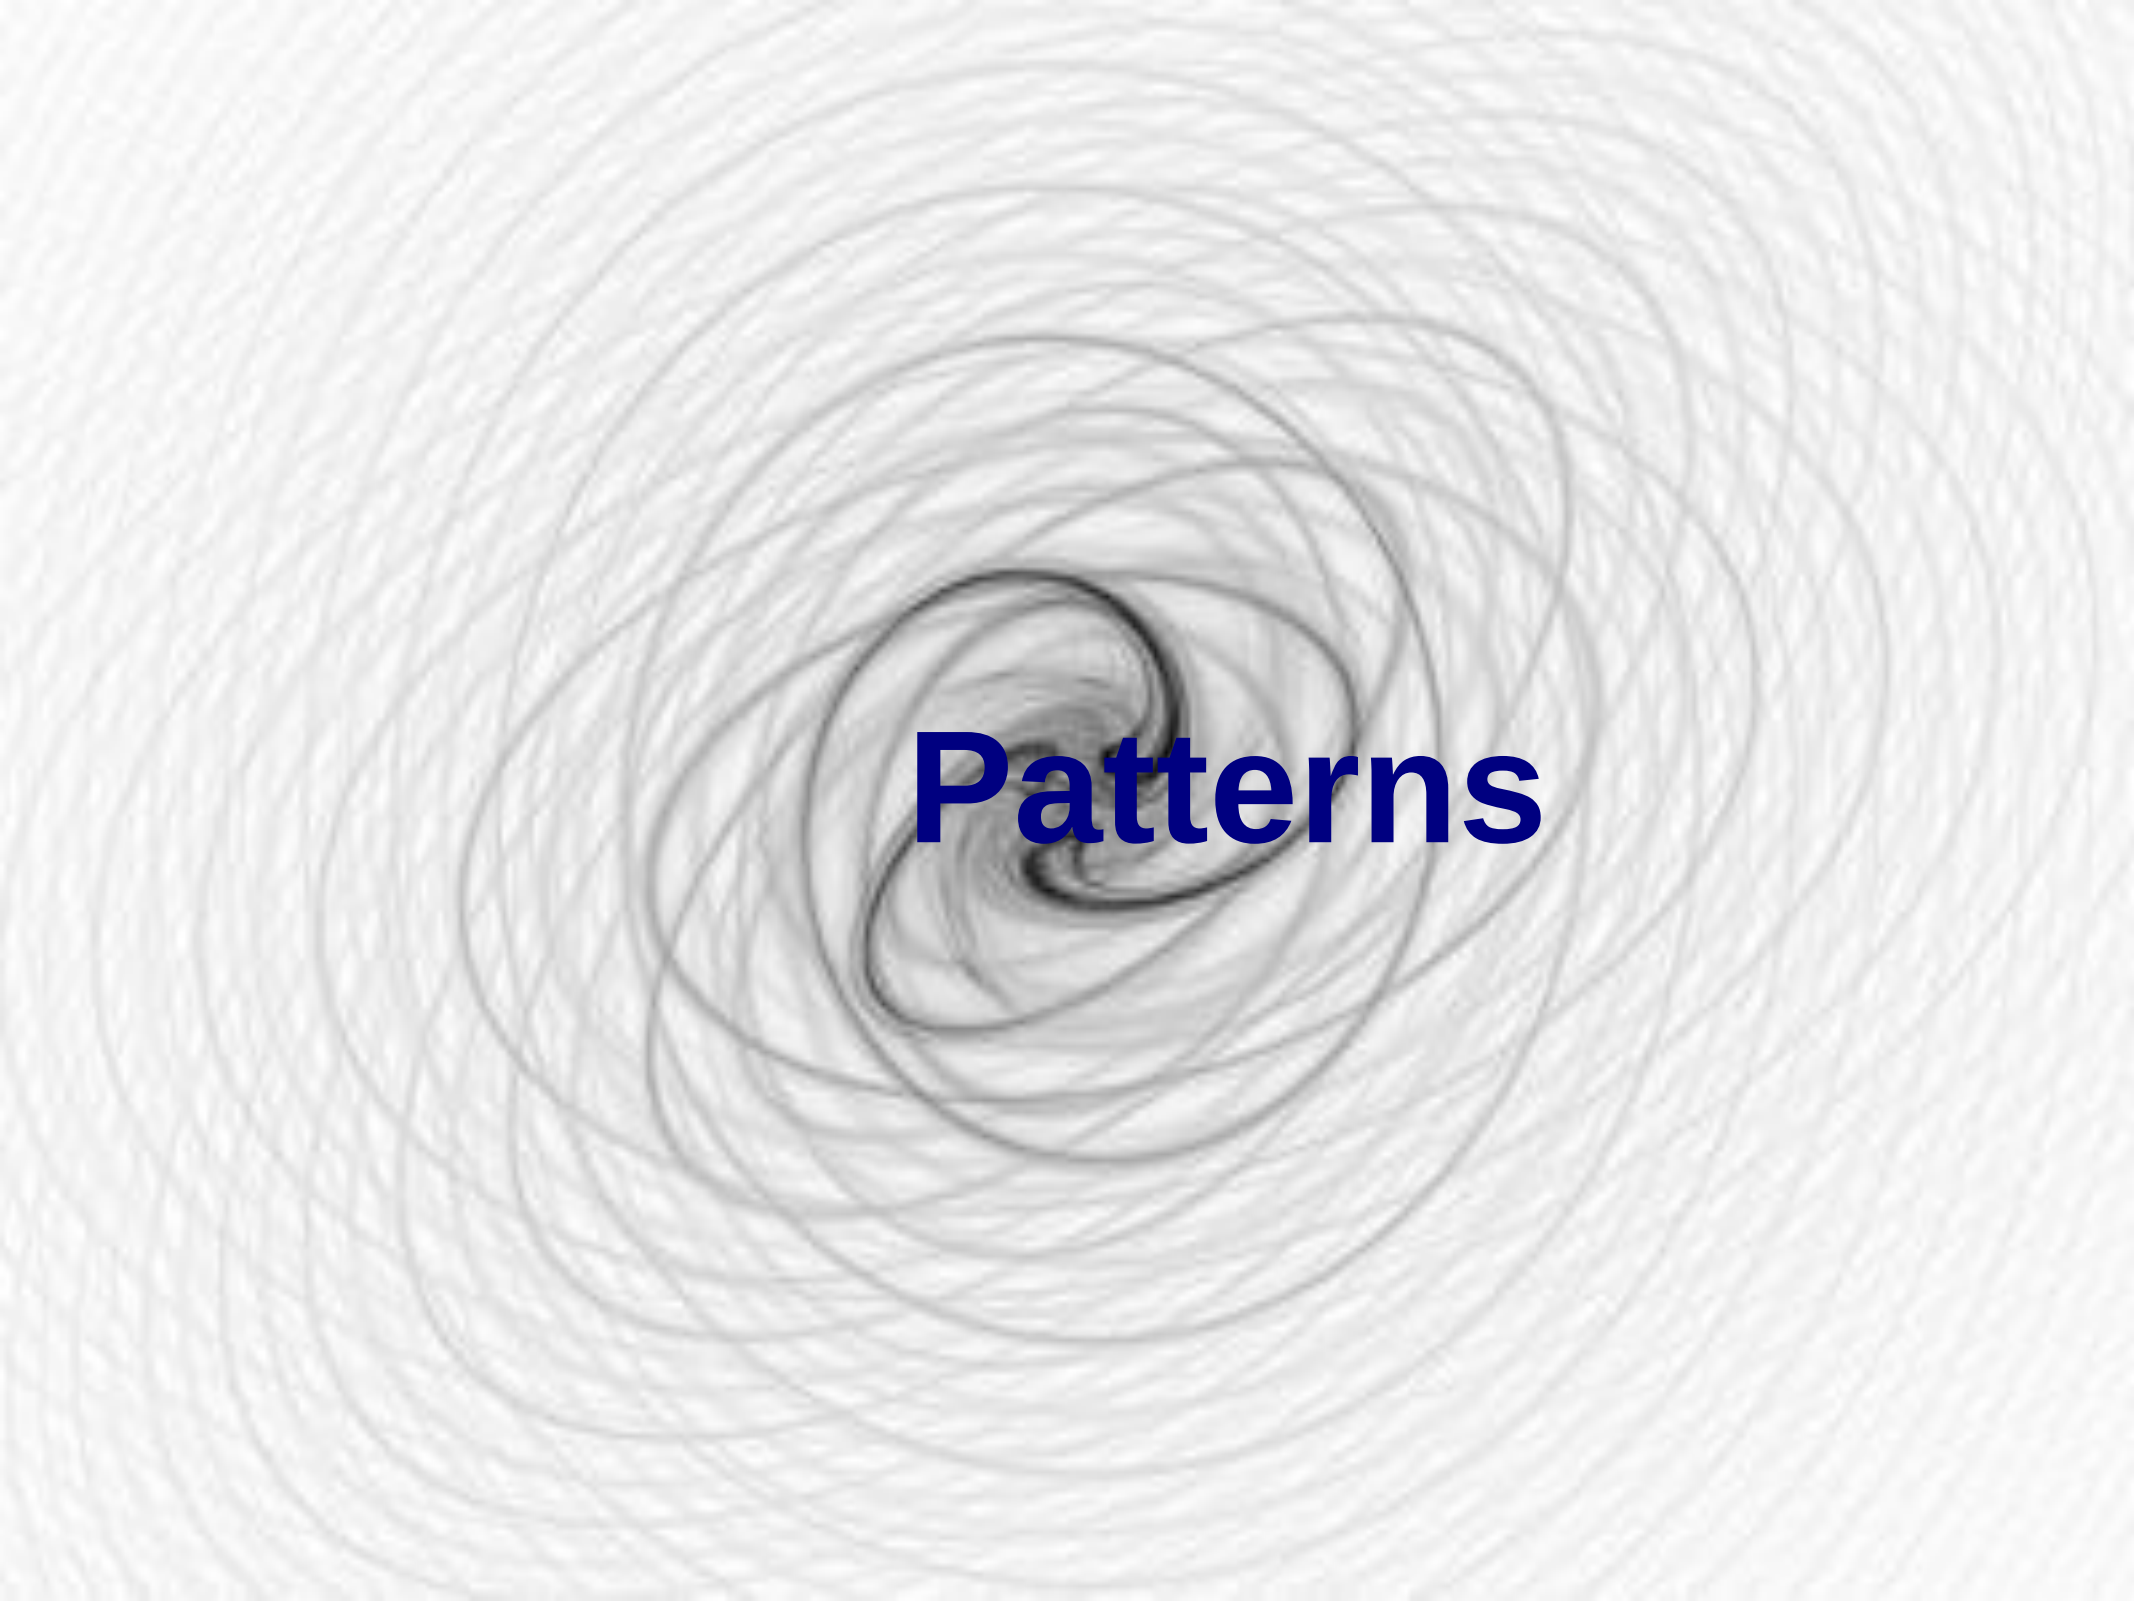
What did we get?

- A pointer to a table set in a global address (In the data section)
- All currently connected sessions
- A struct with information about every session, such as session id, user name, password...

Version proofed

- Everything is lost with each new update
  - Is it?
  - Hardly ever, because when they add something to a class / struct they add it to the end of it.
  - They hardly ever change the basic stuff
  - It just doesn't happen



Patterns

Automating Update Proof

- Lets say that there are changes in memory structures
  - The patterns survive
  - x86 vs AMD64 vs IA64 vs all the others

Candy

- Python environment to define memory patterns
  - Patterns of shape
    - **Name**
    - **Range**
    - **Data type**
    - **Extra check function**

Range

One of three:

1.End range	*0x10*
2.(start, end)	*(0x10, 0x20)*
3.(start, end, step)	*(0x10, 0x20, 4)*

Data Types

- NUMBER (const value / range / enum, size)
- BUFFER (const value / anything goes, size)
- STRING (Nullterm, is_unicode, isPrintable, const value)
- TIME_STAMP(datetime)
- POINTER
- POINTER_TO_STRUCT
- STRUCT
- ARRAY

Shape example

```
SHAPE(
    "name",
    (0x10, 0x20),
    STRING(“NULLCon") )
```

Example of pattern

Example of pattern

```
Pattern =
  [
    SHAPE("pssSlotsTable", 0x10000,
POINTER_TO_STRUCT(
      [
        SHAPE("next", 0, POINTER()),
        SHAPE("prev", 0, POINTER()),
        SHAPE("name", (0x50, 0x100), STRING("Pss"))
      ]
  ]

# Shape is (Name, Place, Data type, Extra check function)
```

Search on Windows 32bit

```
>>> pattern = [\
        SHAPE('pssSlotsTable', 0x10000, POINTER_TO_STRUCT( STRUCT([
                SHAPE('next', 0, POINTER()),
                SHAPE('prev', 0, POINTER()),
                SHAPE('name', (0x40,0x100), STRING(fixedValue='Pss', isPrintable=False))]))))]
>>> for i in search(pattern, RESOURCE):
        print i

pssSlotsTable: @2002f578 (offset: 00000258) value=553807872
next:   @21027000 (offset: 00000000) value=553631744
prev:   @21027004 (offset: 00000004) value=558133248
name:   @2102706c (offset: 0000006c) value='Pss'

>>>
```

How about Solaris SPARC 64bit?

```
>>> pattern = [\
...     SHAPE('pssSlotsTable', 0x10000, POINTER_TO_STRUCT( STRUCT([
...             SHAPE('next', 0, POINTER()),
...             SHAPE('prev', 0, POINTER()),
...             SHAPE('name', (0x40,0x100), STRING(fixedValue='Pss', i
>>> for i in search(pattern, RESOURCE):
...     print i
...

pssSlotsTable:  @1000001ed30 (offset: 00000430) value=1099538436096L
next:   @10001991000 (offset: 00000000) value=1099538253824L
prev:   @10001991008 (offset: 00000008) value=1099544035328L
name:   @10001991d0 (offset: 000000d0) value='Pss'

>>>
```

Example of complicated pattern

```
          0         4         8         c
 0        0         0         0         0  ................

70 204A7000 204A70C0  204A71E0  204A7230  .pJ .pJ .qJ 0rJ
```

Pattern #2

```
Pattern = [
    SHAPE("cache", (0, 0x10000), STRUCT([
        SHAPE("table_size", 0, NUMBER((0x100, 0x100000))),
        SHAPE("table1",     0, POINTER()),
        SHAPE("table2",     0, POINTER(),
              extraCheck = lambda context:
                  context.table2 ==
                  context.table1 +
                  ((context.table_size + 1) * PSIZE))])))]

# Shape is (Name, Place, Data type, Extra check function)
```
